

**COMPOSITIONS AND METHODS FOR IDENTIFYING AND TARGETING  
CANCER CELLS OF ALIMENTARY CANAL ORIGIN**

**CROSS REFERENCE TO RELATED PATENT APPLICATIONS**

This application claims priority to U.S. Provisional Application Number  
5 60/192,229 filed March 27, 2000, which is incorporated herein by reference.

This application is also related to U.S. Patent Number 5,518,888, issued May  
21, 1996, U.S. Patent Number 5,601,990 issued February 11, 1997, U.S. Patent Number  
6,060,037 issued April 26, 2000, U.S. Patent Number 5,962,220 issued October 5, 1999,  
and U.S. Patent Number 5,879,656 issued March 9, 1999, which are each incorporated  
10 herein by reference and U.S. Patent Application Serial Number 09/180,237 filed March 12,  
1997, which is incorporated herein by reference.

**FIELD OF THE INVENTION**

The present invention relates to *in vitro* diagnostic methods for detecting  
cancer cells of the alimentary canal, particularly primary and metastatic stomach and  
15 esophageal cancer and metastatic colorectal cancer, and to kits and reagents for performing  
such methods. The present invention relates to compounds and methods for *in vivo*  
imaging and treatment of tumors originating from the alimentary canal, particularly  
primary and metastatic stomach and esophageal tumors and metastatic colorectal tumors.  
The present invention relates to methods and compositions for making and using targeted  
20 gene therapy, antisense and drug compositions. The present invention relates to  
prophylactic and therapeutic vaccines against cancer cells of the alimentary canal,

particularly primary and metastatic stomach and esophageal cancer and metastatic colorectal cancer and compositions and methods of making and using the same.

## BACKGROUND OF THE INVENTION

There is a need for reagents, kits and methods for screening, diagnosing and  
5 monitoring individuals with cancer originating from the alimentary canal, particularly primary and metastatic stomach and esophageal cancer and metastatic colorectal cancer. There is a need for reagents, kits and methods for identifying and confirming that a cancer of unknown origin is originating from the alimentary canal and for analyzing tissue and cancer samples to identify and confirm cancer originating from the alimentary canal and to  
10 determine the level of migration of such cancer cells. There is a need for compositions which can specifically target colorectal, stomach and esophageal cancer cells. There is a need for imaging agents which can specifically bind to colorectal, stomach and esophageal cancer cells. There is a need for improved methods of imaging colorectal, stomach and esophageal cancer cells. There is a need for therapeutic agents which can specifically bind  
15 to colorectal, stomach and esophageal cancer cells. There is a need for improved methods of treating individuals who are suspected of suffering from primary and/or metastatic stomach or esophageal cancer or metastatic colorectal cancer. There is a need for vaccine composition to treat colorectal, stomach and esophageal cancer. There is a need for vaccine composition to treat and prevent metastasized colorectal, stomach and esophageal  
20 cancer. There is a need for therapeutic agents which can specifically deliver gene therapeutics, antisense compounds and other drugs to colorectal, stomach and esophageal cancer cells.

## SUMMARY OF THE INVENTION

The invention further relates to *in vitro* methods of determining whether or  
25 not an individual has cancer originating from the alimentary canal, particularly primary and metastatic stomach and esophageal cancer and metastatic colorectal cancer. The present invention relates to *in vitro* methods of examining samples of non-colorectal tissue and body fluids from an individual to determine whether or not CDX1, which is expressed by

normal colon cells and by colorectal, stomach and esophageal tumor cells, is being expressed by cells in samples other than colon. The presence of CDX1 protein or of the CDX1 gene transcript in samples outside the colorectal track is indicative of expression of CDX1 and is evidence that the individual may be suffering from metastasized colon cancer

5 or primary or metastatic stomach and/or esophageal cancer. In patients suspected of suffering from colorectal cancer, the presence of CDX1 protein or of the CDX1 gene transcript in samples outside the colorectal track is supportive of the conclusion that the individual is suffering from metastatic colorectal cancer. The diagnosis of metastatic colorectal cancer may be made or confirmed. In patients suspected of suffering from  
10 stomach or esophageal cancer, the presence of CDX1 protein or of the CDX1 gene transcript in samples outside the colorectal track is supportive of the conclusion that the individual is suffering from primary and/or metastatic stomach or esophageal cancer. The diagnosis of primary and/or metastatic stomach or esophageal cancer may be made or confirmed.

15 The invention further relates to *in vitro* methods of determining whether or not tumor cells are colorectal, stomach or esophageal in origin. The present invention relates to *in vitro* methods of diagnosing whether or not an individual suffering from cancer is suffering from colorectal, stomach or esophageal cancer. The present invention relates to *in vitro* methods of examining samples of tumors from an individual to determine  
20 whether or not CDX1 protein, which is expressed by colorectal, stomach or esophageal tumor cells, is being expressed by the tumor cells. The presence of a CDX1 protein or of the CDX1 gene transcript is indicative of expression of CDX1 and evidence that the individual may be suffering from colorectal, stomach or esophageal cancer. In tumors which are suspected of being colorectal, stomach or esophageal tumors, the presence of a  
25 CDX1 protein or of the CDX1 gene transcript supports the conclusion that the tumors are of colorectal, stomach or esophageal cancer and the diagnosis of colorectal, stomach or esophageal cancer.

The invention further relates to *in vitro* kits for practicing the methods of the invention and to reagents and compositions useful as components in such *in vitro* kits of  
30 the invention.

The invention further relates to a method of imaging primary and metastatic stomach and esophageal tumors and metastatic colorectal tumors and to methods of treating an individual suspected of suffering from primary and metastatic stomach and esophageal tumors and metastatic colorectal tumors comprising the steps of administering  
5 to said individual a pharmaceutical compositions according to the invention, wherein the compositions or conjugated compounds are present in an amount effective for therapeutic or diagnostic use in humans suffering from primary and/or metastatic stomach or esophageal tumors and metastatic colorectal tumors cancer.

The invention further relates to a method of delivering an active agent to  
10 primary and metastatic stomach and esophageal tumor cells and metastatic colorectal tumors cells comprising the steps of administering to an individual who has primary and/or metastatic stomach or esophageal tumors or metastatic colorectal cancer, a pharmaceutical composition comprising a pharmaceutically acceptable carrier or diluent, and an unconjugated compositions that comprises a liposome that includes CDX1 ligands on its  
15 surface and an active component encapsulated therein.

The invention further relates to killed or inactivated colorectal, stomach or esophageal tumor cells that comprise a protein comprising at least one epitope of a CDX1 protein; and to vaccines comprising the same. In some embodiments, the killed or inactivated cells or particles comprise a CDX1 protein. In some embodiments, the killed  
20 or inactivated cells or particles are haptenized.

The invention further relates to methods of treating individuals suffering from colorectal, stomach or esophageal cancer and to methods of treating individuals susceptible colorectal, stomach or esophageal cancer. The method of the present invention provides administering to such individuals an effective amount of such vaccines. The  
25 invention further relates to the use of such vaccines as immunotherapeutics.

## DESCRIPTION OF PREFERRED EMBODIMENTS

### Definitions

As used herein, the term "CDX1" is meant to refer to the cellular protein expressed by normal colorectal cells, as well as primary and metastasized colorectal,

stomach and esophageal cancer cells. In normal individuals, CDX1 is found exclusively in cells of intestine, in particular in cells in the duodenum, small intestine (jejunum and ileum), the large intestine, colon (cecum, ascending colon, transverse colon, descending colon and sigmoid colon) and rectum.

5           As used herein, the term "functional fragment" as used in the term "functional fragment of a CDX1 gene transcript" is meant to refer to fragments of CDX1 gene transcript which are functional with respect to nucleic acid molecules with full length sequences. For example, a functional fragment may be useful as an oligonucleotide or nucleic acid probe, a primer, an antisense oligonucleotide or nucleic acid molecule or a  
10   coding sequence. The nucleotide sequence encoding human CDX1 protein is disclosed in GenBank Accession No. XM 003791, which is incorporated herein by reference.

          As used herein, the term "functional fragment" as used in the term "functional fragment of a CDX1 protein" is meant to fragments of CDX1 protein which function in the same manner as CDX1 protein with full length sequences. For example, an  
15   immunogenically functional fragment of a CDX1 protein comprises an epitope recognized by an anti-CDX1 antibody. A ligand-binding functional fragment of CDX1 comprises a sequence which forms a structure that can bind to a ligand which recognizes and binds to CDX1 protein.

          As used herein, the term "epitope recognized by an anti-CDX1 protein  
20   antibody" refers to those epitopes specifically recognized by an anti-CDX1 protein antibody.

          As used herein, the term "antibody" is meant to refer to complete, intact antibodies, and Fab fragments and F(ab)<sub>2</sub> fragments thereof. Complete, intact antibodies include monoclonal antibodies such as murine monoclonal antibodies, chimeric antibodies  
25   and humanized antibodies.

          As used herein, the term "CDX1 ligand" is meant to refer to compounds which specifically bind to a CDX1 protein. Antibodies that bind to CDX1 are CDX1 ligands. A CDX1 ligand may be a protein, peptide or a non-peptide.

          As used herein, the term "active agent" is meant to refer to compounds that  
30   are therapeutic agents or imaging agents.

As used herein, the term "radiostable" is meant to refer to compounds which do not undergo radioactive decay; i.e. compounds which are not radioactive.

As used herein, the term "therapeutic agent" is meant to refer to chemotherapeutics, toxins, radiotherapeutics, targeting agents or radiosensitizing agents.

- 5 As used herein, the term "chemotherapeutic" is meant to refer to compounds that, when contacted with and/or incorporated into a cell, produce an effect on the cell including causing the death of the cell, inhibiting cell division or inducing differentiation.

As used herein, the term "toxin" is meant to refer to compounds that, when contacted with and/or incorporated into a cell, produce the death of the cell.

- 10 As used herein, the term "radiotherapeutic" is meant to refer to radionuclides which when contacted with and/or incorporated into a cell, produce the death of the cell.

- As used herein, the term "targeting agent" is meant to refer compounds which can be bound by and or react with other compounds. Targeting agents may be used to deliver chemotherapeutics, toxins, enzymes, radiotherapeutics, antibodies or imaging agents to cells that have targeting agents associated with them and/or to convert or otherwise transform or enhance co-administered active agents. A targeting agent may include a moiety that constitutes a first agent that is localized to the cell which when contacted with a second agent either is converted to a third agent which has a desired activity or causes the conversion of the second agent into an agent with a desired activity.
- 15
- 20 The result is the localized agent facilitates exposure of an agent with a desired activity to the cancer cell.

- As used herein, the term "radiosensitizing agent" is meant to refer to agents which increase the susceptibility of cells to the damaging effects of ionizing radiation. A radiosensitizing agent permits lower doses of radiation to be administered and still provide a therapeutically effective dose.
- 25

As used herein, the term "imaging agent" is meant to refer to compounds which can be detected.

As used herein, the term "CDX1 binding moiety" is meant to refer to the portion of a conjugated compound that constitutes an CDX1 ligand.

As used herein, the term "active moiety" is meant to refer to the portion of a conjugated compound that constitutes an active agent.

- As used herein, the terms "conjugated compound" and "conjugated composition" are used interchangeably and meant to refer to a compound which comprises
- 5 a CDX1 binding moiety and an active moiety and which is capable of binding to CDX1. Conjugated compounds according to the present invention comprise a portion which constitutes an CDX1 ligand and a portion which constitutes an active agent. Thus, conjugated compounds according to the present invention are capable of specifically binding to the CDX1 and include a portion which is a therapeutic agent or imaging agent.
- 10 Conjugated compositions may comprise crosslinkers and/or molecules that serve as spacers between the moieties.

- As used herein, the terms "crosslinker", "crosslinking agent", "conjugating agent", "coupling agent", "condensation reagent" and "bifunctional crosslinker" are used interchangeably and are meant to refer to molecular groups which are used to attach the
- 15 CDX1 ligand and the active agent to thus form the conjugated compound.

- As used herein, the term "colorectal cancer" is meant to include the well-accepted medical definition that defines colorectal cancer as a medical condition characterized by cancer of cells of the intestinal tract below the small intestine (i.e. the large intestine (colon), including the cecum, ascending colon, transverse colon, descending
- 20 colon, and sigmoid colon, and rectum). Additionally, as used herein, the term "colorectal cancer" is meant to further include medical conditions which are characterized by cancer of cells of the duodenum and small intestine (jejunum and ileum). The definition of colorectal cancer used herein is more expansive than the common medical definition but is provided as such since the cells of the duodenum and small intestine also contain CDX1.

- 25 As used herein, the term "stomach cancer" is meant to include the well-accepted medical definition that defines stomach cancer as a medical condition characterized by cancer of cells of the stomach.

- As used herein, the term "esophageal cancer" is meant to include the well-accepted medical definition that defines esophageal cancer as a medical condition
- 30 characterized by cancer of cells of the esophagus.

As used herein, the term "metastasis" is meant to refer to the process in which cancer cells originating in one organ or part of the body relocate to another part of the body and continue to replicate. Metastasized cells subsequently form tumors which may further metastasize. Metastasis thus refers to the spread of cancer from the part of the  
5 body where it originally occurs to other parts of the body.

As used herein, the term "metastasized colorectal cancer cells" is meant to refer to colorectal cancer cells which have metastasized. Metastasized colorectal cancer cells localized in a part of the body other than the duodenum, small intestine (jejunum and ileum), large intestine (colon), including the cecum, ascending colon, transverse colon,  
10 descending colon, and sigmoid colon, and rectum.

As used herein, the term "metastasized stomach cancer cells" is meant to refer to stomach cancer cells which have metastasized. Metastasized stomach cancer cells localized in a part of the body other than the stomach.

As used herein, the term "metastasized esophageal cancer cells" is is meant to refer to colorectal cancer cells which have metastasized. Metastasized esophageal cancer cells localized in a part of the body other than the esophagus.  
15

As used herein, the term "non-colorectal sample" and "extra-intestinal sample" are used interchangeably and meant to refer to a sample of tissue or body fluid from a source other than colorectal tissue. In some preferred embodiments, the non-  
20 colorectal sample is a sample of tissue such as lymph nodes. In some preferred embodiments, the non-colorectal sample is a sample of extra-intestinal tissue which is an adenocarcinoma of unconfirmed origin. In some preferred embodiments, the non-colorectal sample is a blood sample.

As used herein, "an individual suffering from an adenocarcinoma of unconfirmed origin" is meant to refer to an individual who has a tumor in which the origin has not been definitively identified.  
25

As used herein, "an individual is suspected of being susceptible to colorectal, stomach or esophageal cancer" is meant to refer to an individual who is at a particular risk of developing colorectal, stomach or esophageal cancer. Examples of individuals at a  
30 particular risk of developing colorectal, stomach or esophageal cancer are those whose

family medical history indicates above average incidence of colorectal, stomach or esophageal cancer among family members and/or those who have already developed colorectal, stomach or esophageal cancer and have been effectively treated who therefore face a risk of relapse and recurrence.

- 5                   As used herein, the term "antisense composition" and "antisense molecules" are used interchangeably and are meant to refer to compounds that regulate transcription or translation by hybridizing to DNA or RNA and inhibiting and/or preventing transcription or translation from taking place. Antisense molecules include nucleic acid molecules and derivatives and analogs thereof. Antisense molecules hybridize to DNA or RNA in the
- 10 same manner as complementary nucleotide sequences do regardless of whether or not the antisense molecule is a nucleic acid molecule or a derivative or analog. Antisense molecules may inhibit or prevent transcription or translation of genes whose expression is linked to cancer.

- As used herein, the term "CDX1 immunogen" is meant to refer to CDX1
- 15 protein or a fragment thereof or a protein that comprises the same or a haptenized product thereof, cells and particles which display at least one CDX1 epitope, and haptenized cells and haptenized particles which display at least one CDX1 epitope.

- As used herein, the term "recombinant expression vector" is meant to refer to a plasmid, phage, viral particle or other vector which, when introduced into an appropriate
- 20 host, contains the necessary genetic elements to direct expression of the coding sequence that encodes the protein. The coding sequence is operably linked to the necessary regulatory sequences. Expression vectors are well known and readily available. Examples of expression vectors include plasmids, phages, viral vectors and other nucleic acid molecules or nucleic acid molecule containing vehicles useful to transform host cells and
- 25 facilitate expression of coding sequences.

- As used herein, the term "illegitimate transcription" is meant to refer to the low level or background expression of tissue-specific genes in cells from other tissues. The phenomenon of illegitimate transcription thus provides copies of mRNA for a tissue specific transcript in other tissues. If detection techniques used to detect gene expression
- 30 are sufficiently sensitive to detect illegitimate transcription, the expression level of the

- transcript in negative samples due to illegitimate transcription must be discounted using controls and/or quantitative assays and/or other means to eliminate the incidence of false positive due to illegitimate transcription. Alternatively, detection of evidence of CDX1 gene expression in sample is achieved without detecting CDX1 gene transcript present due to illegitimate transcription. This is accomplished using techniques which are not sufficiently sensitive to detect the CDX1 gene transcript present due to illegitimate transcription which is present as background.

### CDX1

- Carcinomas derived from the colorectal cells, stomach or esophagus express CDX1. The expression of CDX1 by such tumors enables this protein and its mRNA to be a specific biomarker for the presence of cancer cells in extra-intestinal tissues and blood. Indeed, this characteristic permits the detection of CDX1 mRNA by RT-PCR analysis to be a diagnostic test to stage patients with colorectal, stomach or esophageal cancer and follow patients after surgery for evidence of recurrent disease in their blood as well as to detect colorectal, stomach and esophageal cancers. Further, the CDX1 may be targeted with a ligand conjugated to an active agent in order to deliver the active agent to tumor cells *in vivo*.

- U.S. Patent No. 5,518,888 issued May 21, 1996 to Waldman, PCT application PCT/US94/12232 filed October 26, 1994, U.S. Application Serial No. 08/467,920 filed June 6, 1995, and U.S. Application Serial No. 08/583,447 filed January 5, 1996, which are each incorporated herein by reference, disclose that metastasized colorectal tumors can be targeted for delivery of active compounds by targeting ST receptors (also referred to as guanylin cyclase C or GCC). The presence of ST receptors on cells outside of the intestinal tract as a marker for colorectal cancer allows for the screening, identification and treatment of individuals with metastasized colorectal tumors. ST receptors may also be used to target delivery of gene therapeutics and antisense compounds to colorectal cells.

U.S. Patent No. 5,601,990 issued February 11, 1997 to Waldman, PCT application PCT/US94/12232 filed October 26, 1994, and PCT application

PCT/US97/07467 filed May 2, 1997, which are each incorporated herein by reference, disclose that detection of evidence of expression of ST receptors in samples of tissue and body fluid from outside the intestinal track indicate metastasized colorectal cancer.

- PCT application PCT/US97/07565 filed May 2, 1997, which is incorporated
- 5 herein by reference, disclose that immunogens with epitopes that can be targeted by antibodies that react with ST receptors can be used in vaccines compositions useful as prophylactic and therapeutic anti-metastatic colorectal cancer compositions.

- It has been discovered that in addition to normal colon cells, primary and metastasized colon, stomach and esophageal carcinoma cells express CDX1. Normal
- 10 stomach and esophageal cells do not express CDX1. Thus, the present invention provides the use of CDX1 as a specific molecular diagnostic marker for the diagnosis, staging, and post-operative surveillance of patients with metastasized colon cancer and primary and metastasized stomach and esophageal cancer.

- Detection of the expression of CDX1 employing molecular techniques,
- 15 including, but not limited to, RT-PCR, can be employed to diagnose and stage patients, follow the development of recurrence after surgery and/or remission, and, potentially, screen normal people for the development of colorectal, stomach or esophageal cancer.

- The amino acid of the CDX1 protein and the nucleotide sequence of the CDX1 gene transcript is set forth in GenBank Accession No. XM 003791, which is
- 20 incorporated herein by reference.

- CDX1 is unique in that it is only expressed in normal intestinal cells. Mucosal cells lining the intestine are joined together by tight junctions which form a barrier against the passage of intestinal contents into the blood stream and components of the blood stream into the intestinal lumen. Therefore, the apical location of cells
- 25 expressing CDX1 results in the isolation of such cells from the circulatory system so that they may be considered to exist separate from the rest of the body; essentially the "outside" of the body. Therefore, the rest of the body is considered "outside" the intestinal tract. Compositions administered "outside" the intestinal tract are maintained apart and segregated from the only cells which normally express CDX1. Conversely, tissue samples

taken from tissue outside of the intestinal tract do not normally contain cells which express CDX1.

In individuals suffering from colorectal cancer, the cancer cells are often derived from cells that produce and display the CDX1 and these cancer cells continue to produce CDX1. It has been observed that CDX1 is expressed by colorectal cancer cells. Likewise, CDX1 is expressed by stomach and esophageal cancer cells.

The expression of CDX1 by colorectal tumor cells provides a detectable target for *in vitro* screening, monitoring and staging as well as a target for *in vivo* delivery of conjugated compositions that comprise active agents for the imaging and treatment. CDX1 can also serve as targets for vaccines which may be used to protect against metastasized colorectal cancer or to treat individuals with metastasized colorectal cancer.

The expression of CDX1 by stomach and esophageal tumor cells provides a detectable target for *in vitro* screening, monitoring and staging as well as a target for *in vivo* delivery of conjugated compositions that comprise active agents for the imaging and treatment. CDX1 can also serve as targets for vaccines which may be used to protect against primary and metastatic stomach and esophageal cancer or to treat individuals with primary and metastatic stomach and esophageal cancer.

### ***In vitro* Diagnostics**

According to some embodiments of the invention, compositions, kits and *in vitro* methods are provided for screening, diagnosing and analyzing patients and patient samples to detect evidence of CDX1 expression by cells outside of the intestinal tract wherein the expression of CDX1 may be suggestive of metastasized colorectal cancer or primary or metastatic stomach or esophageal cancer. In patients suspected of having metastasized colorectal cancer or primary or metastatic stomach or esophageal cancer evidence of CDX1 expression by cells outside of the intestinal tract is indicative of metastasized colorectal cancer or primary or metastatic stomach or esophageal cancer and can be used in the diagnosis, monitoring and staging of such patients. Furthermore, the present invention relates to methods, compositions and kits useful in the *in vitro* screening, and analysis of patient and patient samples to detect evidence of CDX1 expression by

tumor cells outside of the intestinal tract wherein the presence of cells that express CDX1-1 suggests or confirms that a tumor is of colorectal or stomach or esophageal cancer origin. In an additional aspect of the invention, compositions, kits and methods are provided which are useful to visualize metastasized colorectal cancer or primary or metastatic stomach or esophageal cancer cells.

- In vitro* screening and diagnostic compositions, methods and kits can be used in the monitoring of individuals who are in high risk groups for colorectal, stomach or esophageal cancer such as those who have been diagnosed with localized disease and/or metastasized disease and/or those who are genetically linked to the disease. *In vitro*
- 10 screening and diagnostic compositions, methods and kits can be used in the monitoring of individuals who are undergoing and/or have been treated for primary colorectal, stomach or esophageal cancer to determine if the cancer has metastasized. *In vitro* screening and diagnostic compositions, methods and kits can be used in the monitoring of individuals who are undergoing and/or have been treated for colorectal, stomach or esophageal cancer
- 15 to determine if the cancer has been eliminated. *In vitro* screening and diagnostic compositions, methods and kits can be used in the monitoring of individuals who are otherwise susceptible, i.e. individuals who have been identified as genetically predisposed such as by genetic screening and/or family histories. Advancements in the understanding of genetics and developments in technology as well as epidemiology allow for the
- 20 determination of probability and risk assessment an individual has for developing stomach or esophageal cancer. Using family health histories and/or genetic screening, it is possible to estimate the probability that a particular individual has for developing certain types of cancer including colorectal, stomach or esophageal cancer. Those individuals that have been identified as being predisposed to developing a particular form of cancer can be
- 25 monitored or screened to detect evidence of colorectal, stomach or esophageal cancer. Upon discovery of such evidence, early treatment can be undertaken to combat the disease. Accordingly, individuals who are at risk for developing colorectal, stomach or esophageal cancer may be identified and samples may be isolated from such individuals. The invention is particularly useful for monitoring individuals who have been identified as
- 30 having family medical histories which include relatives who have suffered from colorectal,

stomach or esophageal cancer. Likewise, the invention is particularly useful to monitor individuals who have been diagnosed as having colorectal, stomach or esophageal cancer and, particularly those who have been treated and had tumors removed and/or are otherwise experiencing remission including those who have been treated for colorectal,  
5 stomach or esophageal cancer.

*In vitro* screening and diagnostic compositions, methods and kits can be used in the analysis of tumors. Expression of CDX1 is a marker for cell type and suggests the origin of adenocarcinoma of unconfirmed origin may be colorectal, stomach or esophageal tumors. Detection of CDX1 expression can also be used to assist in an initial diagnosis of  
10 colorectal, stomach or esophageal cancer or to confirm such diagnosis. Tumors believed to be colorectal, stomach or esophageal in origin can be confirmed as such using the compositions, methods and kits of the invention.

*In vitro* screening and diagnostic compositions, kits and methods of the invention can be used to analyze tissue samples from the stomach or esophagus to identify  
15 primary stomach or esophageal cancer.

*In vitro* screening and diagnostic compositions, kits and methods of the invention can be used to analyze tissue samples from the colon to detect the amount of invasion by primary colorectal cancer into the intestinal tissue.

According to the invention, compounds are provided which bind to CDX1  
20 gene transcript or protein. Normal tissue in the body does not have CDX1 transcript or protein except cells of the intestinal tract. The expression of CDX1 is a marker for cell type and is useful in the identification of colorectal, stomach or esophageal cancer in extra-intestinal samples.

In some embodiments of the invention, non-colorectal tissue and fluid  
25 samples or tumor samples may be screened to identify the presence or absence of CDX1 protein. Techniques such as ELISA assays and Western blots may be performed to determine whether CDX1 is present in a sample.

In some embodiments of the invention, non-colorectal tissue and fluid samples or tumor samples may be screened to identify whether CDX1 are being expressed  
30 in cells outside of the colorectal tract by detecting the presence or absence of CDX1 gene

transcript. The presence of CDX1 gene transcript or cDNA generated therefrom can be determined using techniques such as PCR amplification, branched oligonucleotide technology, Northern Blots (mRNA), Southern Blots (cDNA), or oligonucleotide hybridization.

- 5                    In some embodiments of the invention, cells of non-colorectal tissue samples or tumor samples may be examined to identify the presence or absence of CDX1 proteins. Techniques such as immunohistochemistry blots may be performed on tissue sections to determine whether CDX1 are present in a sample.

- 10                   In some embodiments of the invention, cells of non-colorectal tissue samples or tumor samples may be examined to determine whether CDX1 are being expressed in cells outside of the colorectal tract by detecting the presence or absence of the CDX1 gene transcript. The presence of the CDX1 gene transcript or cDNA generated therefrom in cells from tissue sections can be determined using techniques such as *in situ* hybridization.

- 15                   The presence of CDX1 in non-colorectal tissue and fluid samples or on cells from non-colorectal tissue samples suggests possible stomach or esophageal cancer. The presence of CDX1 in a tumor sample or on tumor cells suggests that the tumor may be colorectal, stomach or esophageal in origin. The presence of the CDX1 gene transcript in non-colorectal tissue and fluid samples or in cells from non-colorectal tissue samples suggests possible colorectal, stomach or esophageal cancer. The presence of the CDX1  
20                   gene transcript in tumor samples and tumor cells suggests that the tumor may be colorectal, stomach or esophageal in origin.

- Samples may be obtained from resected tissue or biopsy material including needle biopsy. Tissue section preparation for surgical pathology may be frozen and prepared using standard techniques. Immunohistochemistry and *in situ* hybridization  
25                   binding assays on tissue sections are performed in fixed cells. Extra-intestinal samples may be homogenized by standard techniques such as sonication, mechanical disruption or chemical lysis such as detergent lysis. It is also contemplated that tumor samples in body fluids such as blood, urine, lymph fluid, cerebral spinal fluid, amniotic fluid, vaginal fluid, semen and stool samples may also be screened to determine if such tumors are colorectal,  
30                   stomach or esophageal in origin.

Non-colorectal tissue samples may be obtained from any tissue except those of the colorectal tract, i.e. the intestinal tract below the small intestine (i.e. the large intestine (colon), including the cecum, ascending colon, transverse colon, descending colon, and sigmoid colon, and rectum) and additionally the duodenum and small intestine (jejunum and ileum). The normal cells of all tissue except those of the colorectal tract do not express CDX1. Thus if CDX1 protein or the CDX1 gene transcript are detected in non-colorectal samples, the possible presence of colorectal, stomach or esophageal cancer cells is suggested. In some preferred embodiments, the tissue samples are lymph nodes.

Tissue samples may be obtained by standard surgical techniques including use of biopsy needles. One skilled in the art would readily appreciate the variety of test samples that may be examined for CDX1 and recognize methods of obtaining tissue samples.

Tissue samples may be homogenized or otherwise prepared for screening for the presence of CDX1 by well known techniques such as sonication, mechanical disruption, chemical lysis such as detergent lysis or combinations thereof.

Examples of body fluid samples include blood, urine, lymph fluid, cerebral spinal fluid, amniotic fluid, vaginal fluid and semen. In some preferred embodiments, blood is used as a sample of body fluid. Cells may be isolated from fluid sample such as centrifugation. One skilled in the art would readily appreciate the variety of test samples that may be examined for CDX1. Test samples may be obtained by such methods as withdrawing fluid with a syringe or by a swab. One skilled in the art would readily recognize other methods of obtaining test samples.

In an assay using a blood sample, the blood plasma may be separated from the blood cells. The blood plasma may be screened for CDX1 including truncated proteins which are released into the blood when one or more CDX1 are cleaved from or sloughed off from tumor cells. In some embodiments, blood cell fractions are screened for the presence of colorectal, stomach or esophageal tumor cells. In some embodiments, lymphocytes present in the blood cell fraction are screened by lysing the cells and detecting the presence of CDX1 protein or the CDX1 gene transcript which may be present as a result of the presence of any stomach or esophageal tumor cells that may have been

engulfed by the blood cell. In some preferred embodiments, CD34+ cells are removed prior to isolation of mRNA from samples using commercially available immuno-columns.

Aspects of the present invention include various methods of determining whether a sample contains cells that express CDX1 by nucleotide sequence-based  
5 molecular analysis to detect the CDX1 gene transcript. Several different methods are available for doing so including those using Polymerase Chain Reaction (PCR) technology, branched oligonucleotide technology, Northern blot technology, oligonucleotide hybridization technology, and *in situ* hybridization technology.

The invention relates to oligonucleotide probes and primers used in the  
10 methods of identifying the CDX1 gene transcript and to diagnostic kits which comprise such components.

The mRNA sequence-based methods for detect the CDX1 gene transcript include but are not limited to polymerase chain reaction technology, branched oligonucleotide technology, Northern and Southern blot technology, *in situ* hybridization  
15 technology and oligonucleotide hybridization technology.

The methods described herein are meant to exemplify how the present invention may be practiced and are not meant to limit the scope of invention. It is contemplated that other sequence-based methodology for detecting the presence of the CDX1 gene transcript in non-colorectal samples may be employed according to the  
20 invention.

A preferred method to detecting the CDX1 gene transcript in genetic material derived from non-colorectal samples uses polymerase chain reaction (PCR) technology. PCR technology is practiced routinely by those having ordinary skill in the art and its uses in diagnostics are well known and accepted. Methods for practicing PCR technology are  
25 disclosed in "PCR Protocols: A Guide to Methods and Applications", Innis, M.A., *et al.* Eds. Academic Press, Inc. San Diego, CA (1990) which is incorporated herein by reference. Applications of PCR technology are disclosed in "Polymerase Chain Reaction" Erlich, H.A., *et al.*, Eds. Cold Spring Harbor Press, Cold Spring Harbor, NY (1989) which is incorporated herein by reference. U.S. Patent Number 4,683,202, U.S. Patent Number  
30 4,683,195, U.S. Patent Number 4,965,188 and U.S. Patent Numbers 5,075,216, which are

each incorporated herein by reference describe methods of performing PCR. PCR may be routinely practiced using Perkin Elmer Cetus GENE AMP RNA PCR kit, Part No. N808-0017.

PCR technology allows for the rapid generation of multiple copies of DNA sequences by providing 5' and 3' primers that hybridize to sequences present in an RNA or DNA molecule, and further providing free nucleotides and an enzyme which fills in the complementary bases to the nucleotide sequence between the primers with the free nucleotides to produce a complementary strand of DNA. The enzyme will fill in the complementary sequences adjacent to the primers. If both the 5' primer and 3' primer hybridize to nucleotide sequences on the same small fragment of nucleic acid, exponential amplification of a specific double-stranded size product results. If only a single primer hybridizes to the nucleic acid fragment, linear amplification produces single-stranded products of variable length.

PCR primers can be designed routinely by those having ordinary skill in the art using sequence information. The nucleotide sequence of the CDX1 gene transcript is set forth in SEQ ID NO:1. To perform this method, RNA is extracted from cells in a sample and tested or used to make cDNA using well known methods and readily available starting materials. Those having ordinary skill in the art can readily prepare PCR primers. A set of primers generally contains two primers. When performing PCR on extracted mRNA or cDNA generated therefrom, if the CDX1 gene transcript or cDNA generated therefrom is present, multiple copies of the mRNA or cDNA will be made. If it is not present, PCR will not generate a discrete detectable product. Primers are generally 8-50 nucleotides, preferably about 15-35 nucleotides, more preferably 18-28 nucleotides, which are identical or complementary to and therefor hybridize to the CDX1 gene transcript or cDNA generated therefrom. In preferred embodiments, the primers are each 15-35 nucleotide, more preferably 18-28 nucleotide fragments of SEQ ID NO:1. The primer must hybridize to the sequence to be amplified. Typical primers are 18-28 nucleotides in length and are generally have 50% to 60% G+C composition. The entire primer is preferably complementary to the sequence it must hybridize to. Preferably, primers generate PCR products 100 base pairs to 2000 base pairs. However, it is possible to

generate products of 50 to up to 10 kb and more. If mRNA is used as a template, the primers must hybridize to mRNA sequences. If cDNA is used as a template, the primers must hybridize to cDNA sequences.

The mRNA or cDNA is combined with the primers, free nucleotides and  
5 enzyme following standard PCR protocols. The mixture undergoes a series of temperature changes. If the CDX1 gene transcript or cDNA generated therefrom is present, that is, if both primers hybridize to sequences on the same molecule, the molecule comprising the primers and the intervening complementary sequences will be exponentially amplified. The amplified DNA can be easily detected by a variety of well known means. If no CDX1  
10 gene transcript or cDNA generated therefrom is present, no PCR product will be exponentially amplified. The PCR technology therefore provides an extremely easy, straightforward and reliable method of detecting the CDX1 gene transcript in a sample.

PCR product may be detected by several well known means. The preferred method for detecting the presence of amplified DNA is to separate the PCR reaction  
15 material by gel electrophoresis and stain the gel with ethidium bromide in order to visualize the amplified DNA if present. A size standard of the expected size of the amplified DNA is preferably run on the gel as a control.

In some instances, such as when unusually small amounts of RNA are recovered and only small amounts of cDNA are generated therefrom, it is desirable or  
20 necessary to perform a PCR reaction on the first PCR reaction product. That is, if difficult to detect quantities of amplified DNA are produced by the first reaction, a second PCR can be performed to make multiple copies of DNA sequences of the first amplified DNA. A nested set of primers are used in the second PCR reaction. The nested set of primers hybridize to sequences downstream of the 5' primer and upstream of the 3' primer used in  
25 the first reaction.

The present invention includes oligonucleotide which are useful as primers for performing PCR methods to amplify the CDX1 gene transcript or cDNA generated therefrom.

According to the invention, diagnostic kits can be assembled which are  
30 useful to practice methods of detecting the presence of the CDX1 gene transcript or cDNA

generated therefrom in non-colorectal samples. Such diagnostic kits comprise oligonucleotide which are useful as primers for performing PCR methods. It is preferred that diagnostic kits according to the present invention comprise a container comprising a size marker to be run as a standard on a gel used to detect the presence of amplified DNA.

- 5 The size marker is the same size as the DNA generated by the primers in the presence of the CDX1 gene transcript or cDNA generated therefrom. Additional components in some kits include instructions for carrying out the assay. Additionally the kit may optionally comprise depictions or photographs that represent the appearance of positive and negative results. Positive and negative controls may also be provided.

- 10 PCR assays are useful for detecting the CDX1 gene transcript in homogenized tissue samples and cells in body fluid samples. It is contemplated that PCR on the plasma portion of a fluid sample could be used to detect the CDX1 gene transcript.

- Another method of determining whether a sample contains cells expressing CDX1 is by branched chain oligonucleotide hybridization analysis of mRNA extracted  
15 from a sample. Branched chain oligonucleotide hybridization may be performed as described in U.S. Patent Number 5,597,909, U.S. Patent Number 5,437,977 and U.S. Patent Number 5,430,138, which are each incorporated herein by reference. Reagents may be designed following the teachings of those patents and that sequence of the CDX1 gene transcript.

- 20 Another method of determining whether a sample contains cells expressing CDX1 is by Northern Blot analysis of mRNA extracted from a non-colorectal sample. The techniques for performing Northern blot analyses are well known by those having ordinary skill in the art and are described in Sambrook, J. *et al.*, (1989) *Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY.  
25 mRNA extraction, electrophoretic separation of the mRNA, blotting, probe preparation and hybridization are all well known techniques that can be routinely performed using readily available starting material.

- The mRNA is extracted using poly dT columns and the material is separated by electrophoresis and, for example, transferred to nitrocellulose paper. Labeled probes  
30 made from an isolated specific fragment or fragments can be used to visualize the presence

of a complementary fragment fixed to the paper. Probes useful to identify mRNA in a Northern Blot have a nucleotide sequence that is complementary to the CDX1 gene transcript. Those having ordinary skill in the art could use the sequence information in SEQ ID NO:1 to design such probes or to isolate and clone the CDX1 gene transcript or

- 5 cDNA generated therefrom to be used as a probe. Such probes are at least 15 nucleotides, preferably 30-200, more preferably 40-100 nucleotide fragments and may be the entire CDX1 gene transcript.

- According to the invention, diagnostic kits can be assembled which are useful to practice methods of detecting the presence of the CDX1 gene transcript in non-
- 10 colorectal samples by Northern blot analysis. Such diagnostic kits comprise oligonucleotide which are useful as probes for hybridizing to the mRNA. The probes may be radiolabeled. It is preferred that diagnostic kits according to the present invention comprise a container comprising a size marker to be run as a standard on a gel. It is preferred that diagnostic kits according to the present invention comprise a container
- 15 comprising a positive control which will hybridize to the probe. Additional components in some kits include instructions for carrying out the assay. Additionally the kit may optionally comprise depictions or photographs that represent the appearance of positive and negative results.

- Northern blot analysis is useful for detecting the CDX1 gene transcript in
- 20 homogenized tissue samples and cells in body fluid samples. It is contemplated that PCR on the plasma portion of a fluid sample could be used to detect the CDX1 gene transcript.

- Another method of detecting the presence of the CDX1 gene transcript by oligonucleotide hybridization technology. Oligonucleotide hybridization technology is well known to those having ordinary skill in the art. Briefly, detectable probes which
- 25 contain a specific nucleotide sequence that will hybridize to nucleotide sequence of the CDX1 gene transcript. RNA or cDNA made from RNA from a sample is fixed, usually to filter paper or the like. The probes are added and maintained under conditions that permit hybridization only if the probes fully complement the fixed genetic material. The conditions are sufficiently stringent to wash off probes in which only a portion of the probe

hybridizes to the fixed material. Detection of the probe on the washed filter indicate complementary sequences.

- Probes useful in oligonucleotide assays at least 18 nucleotides of complementary DNA and may be as large as a complete complementary sequence to the
- 5 CDX1 gene transcript. In some preferred embodiments the probes of the invention are 30-200 nucleotides, preferably 40-100 nucleotides.

- One having ordinary skill in the art, using the sequence information disclosed in SEQ ID NO:1 can design probes useful in the invention. Hybridization conditions can be routinely optimized to minimize background signal by non-fully complementary
- 10 hybridization. In some preferred embodiments, the probes are full length clones. Probes are at least 15 nucleotides, preferably 30-200, more preferably 40-100 nucleotide fragments and may be the entire CDX1 gene transcript.

- The present invention includes labeled oligonucleotide which are useful as probes for performing oligonucleotide hybridization. The labeled probes of the present
- 15 invention are labeled with radiolabeled nucleotides or are otherwise detectable by readily available nonradioactive detection systems.

- According to the invention, diagnostic kits can be assembled which are useful to practice oligonucleotide hybridization methods of the invention. Such diagnostic kits comprise a labeled oligonucleotide which encodes portions of the CDX1 gene
- 20 transcript. It is preferred that labeled probes of the oligonucleotide diagnostic kits according to the present invention are labeled with a radionucleotide. The oligonucleotide hybridization-based diagnostic kits according to the invention preferably comprise DNA samples that represent positive and negative controls. A positive control DNA sample is one that comprises a nucleic acid molecule which has a nucleotide sequence that is fully
- 25 complementary to the probes of the kit such that the probes will hybridize to the molecule under assay conditions. A negative control DNA sample is one that comprises at least one nucleic acid molecule, the nucleotide sequence of which is partially complementary to the sequences of the probe of the kit. Under assay conditions, the probe will not hybridize to the negative control DNA sample. Additional components in some kits include

instructions for carrying out the assay. Additionally the kit may optionally comprise depictions or photographs that represent the appearance of positive and negative results.

- Oligonucleotide hybridization techniques are useful for detecting the CDX1 gene transcript in homogenized tissue samples and cells in body fluid samples. It is
- 5 contemplated that PCR on the plasma portion of a fluid sample could be used to detect the CDX1 gene transcript.

- The present invention relates to *in vitro* kits for evaluating samples of tumors to determine whether or not they are colorectal, stomach or esophageal in origin and to reagents and compositions useful to practice the same. In some embodiments of the
- 10 invention, tumor samples may be isolated from individuals undergoing or recovery from surgery to remove tumors in the colorectal, stomach or esophagus, tumors in other organs or biopsy material. The tumor sample is analyzed to identify the presence or absence of the CDX1 gene transcript. Techniques such as immunohistochemistry assays may be performed to determine whether CDX1 are present in cells in the tumor sample. The
- 15 presence of mRNA that encodes the CDX1 protein or cDNA generated therefrom can be determined using techniques such as *in situ* hybridization, immunohistochemistry and *in situ* ST binding assay.

- In situ* hybridization technology is well known by those having ordinary skill in the art. Briefly, cells are fixed and detectable probes which contain a specific nucleotide
- 20 sequence are added to the fixed cells. If the cells contain complementary nucleotide sequences, the probes, which can be detected, will hybridize to them.

- Probes useful in oligonucleotide assays at least 18 nucleotides of complementary DNA and may be as large as a complete complementary sequence to the CDX1 gene transcript. In some preferred embodiments the probes of the invention are 30-
- 25 200 nucleotides, preferably 40-100 nucleotides.

- One having ordinary skill in the art, using the sequence information set forth in SEQ ID NO:1 can design probes useful in *in situ* hybridization technology to identify cells that express CDX1. Probes preferably hybridizes to a nucleotide sequence that corresponds to the CDX1 gene transcript. Hybridization conditions can be routinely
- 30 optimized to minimize background signal by non-fully complementary hybridization.

Probes preferably hybridize to the full length CDX1 gene transcript. Probes are at least 15 nucleotides, preferably 30-200, more preferably 40-100 nucleotide fragments and may be the CDX1 gene transcript, more preferably 18-28 nucleotide fragments of the CDX1 gene transcript.

- 5                   The probes are fully complementary and do not hybridize well to partially complementary sequences. For *in situ* hybridization according to the invention, it is preferred that the probes are detectable by fluorescence. A common procedure is to label probe with biotin-modified nucleotide and then detect with fluorescently tagged avidin. Hence, probe does not itself have to be labeled with fluorescent but can be subsequently  
10 detected with fluorescent marker.

- The present invention includes labeled oligonucleotide which are useful as probes for performing oligonucleotide hybridization. That is, they are fully complementary with mRNA sequences but not genomic sequences. The labeled probes of the present invention are labeled with radiolabeled nucleotides or are otherwise detectable  
15 by readily available nonradioactive detection systems.

                  The present invention relates to probes useful for *in situ* hybridization to identify cells that express CDX1.

- Cells are fixed and the probes are added to the genetic material. Probes will hybridize to the complementary nucleic acid sequences present in the sample. Using a  
20 fluorescent microscope, the probes can be visualized by their fluorescent markers.

- According to the invention, diagnostic kits can be assembled which are useful to practice *in situ* hybridization methods of the invention are fully complementary with mRNA sequences but not genomic sequences. For example, the mRNA sequence includes different exon sequences. It is preferred that labeled probes of the *in situ*  
25 diagnostic kits according to the present invention are labeled with a fluorescent marker.

- Immunohistochemistry techniques may be used to identify and essentially stain cells with CDX1. Such "staining" allows for analysis of metastatic migration. Anti-CDX1 antibodies such as those described above of contacted with fixed cells and the CDX1 present in the cells reacts with the antibodies. The antibodies are detectably labeled  
30 or detected using labeled second antibody or protein A to stain the cells.

The techniques described herein for evaluating tumor sections can also be used to analyze tissue sections for samples of lymph nodes as well as other tissues to identify the presence of cells that express CDX1. The samples can be prepared and "stained" to detect expression of CDX1.

- 5                   Immunoassay methods may be used in the diagnosis of individuals suffering from colorectal, stomach or esophageal cancer by detecting presence of CDX1 in sample of non-colorectal tissue or body fluid from an individuals suspected of having or being susceptible to colorectal, stomach or esophageal cancer using antibodies which were produced in response to exposure to such CDX1 protein. Moreover, immunoassay
- 10 methods may be used to identify individuals suffering from colorectal, stomach or esophageal cancer by detecting presence of CDX1 in sample of tumor using antibodies which were produced in response to exposure to such CDX1 protein.

- The antibodies are preferably monoclonal antibodies. The antibodies are preferably raised against CDX1 made in human cells. Immunoassays are well known and
- 15 there design may be routinely undertaken by those having ordinary skill in the art. Those having ordinary skill in the art can produce monoclonal antibodies which specifically bind to CDX1 and are useful in methods and kits of the invention using standard techniques and readily available starting materials. The techniques for producing monoclonal antibodies are outlined in Harlow, E. and D. Lane, (1988) *ANTIBODIES: A Laboratory Manual*, Cold
- 20 Spring Harbor Laboratory, Cold Spring Harbor NY, which is incorporated herein by reference, provide detailed guidance for the production of hybridomas and monoclonal antibodies which specifically bind to target proteins. It is within the scope of the present invention to include Fabs, recombinant Fabs, F(Ab)<sub>2</sub>s, recombinant F(Ab)<sub>2</sub>s which specifically bind to CDX1 translation products in place of antibodies.

- 25                   Briefly, CDX1 protein is injected into mice. The spleen of the mouse is removed, the spleen cells are isolated and fused with immortalized mouse cells. The hybrid cells, or hybridomas, are cultured and those cells which secrete antibodies are selected. The antibodies are analyzed and, if found to specifically bind to the CDX1, the hybridoma which produces them is cultured to produce a continuous supply of anti-CDX1
- 30 specific antibodies.

The antibodies are preferably monoclonal antibodies. The antibodies are preferably raised against CDX1 made in human cells.

The means to detect the presence of a protein in a test sample are routine and one having ordinary skill in the art can detect the presence or absence of a protein or an antibody using well known methods. One well known method of detecting the presence of a protein is an immunoassay. One having ordinary skill in the art can readily appreciate the multitude of ways to practice an immunoassay to detect the presence of a CDX1 protein in a sample.

According to some embodiments, immunoassays comprise allowing proteins in the sample to bind a solid phase support such as a plastic surface. Detectable antibodies are then added which selectively binding to the CDX1. Detection of the detectable antibody indicates the presence of CDX1. The detectable antibody may be a labeled or an unlabeled antibody. Unlabeled antibody may be detected using a second, labeled antibody that specifically binds to the first antibody or a second, unlabeled antibody which can be detected using labeled protein A, a protein that complexes with antibodies. Various immunoassay procedures are described in *Immunoassays for the 80's*, A. Voller et al., Eds., University Park, 1981, which is incorporated herein by reference.

Simple immunoassays may be performed in which a solid phase support is contacted with the test sample. Any proteins present in the test sample bind the solid phase support and can be detected by a specific, detectable antibody preparation. Such a technique is the essence of the dot blot, Western blot and other such similar assays.

Other immunoassays may be more complicated but actually provide excellent results. Typical and preferred immunometric assays include "forward" assays for the detection of a protein in which a first anti-protein antibody bound to a solid phase support is contacted with the test sample. After a suitable incubation period, the solid phase support is washed to remove unbound protein. A second, distinct anti-protein antibody is then added which is specific for a portion of the specific protein not recognized by the first antibody. The second antibody is preferably detectable. After a second incubation period to permit the detectable antibody to complex with the specific protein bound to the solid phase support through the first antibody, the solid phase support is

washed a second time to remove the unbound detectable antibody. Alternatively, the second antibody may not be detectable. In this case, a third detectable antibody, which binds the second antibody is added to the system. This type of "forward sandwich" assay may be a simple yes/no assay to determine whether binding has occurred or may be made  
5 quantitative by comparing the amount of detectable antibody with that obtained in a control. Such "two-site" or "sandwich" assays are described by Wide, *Radioimmune Assay Method*, Kirkham, Ed., E. & S. Livingstone, Edinburgh, 1970, pp. 199-206, which is incorporated herein by reference.

- Other types of immunometric assays are the so-called "simultaneous" and  
10 "reverse" assays. A simultaneous assay involves a single incubation step wherein the first antibody bound to the solid phase support, the second, detectable antibody and the test sample are added at the same time. After the incubation is completed, the solid phase support is washed to remove unbound proteins. The presence of detectable antibody associated with the solid support is then determined as it would be in a conventional  
15 "forward sandwich" assay. The simultaneous assay may also be adapted in a similar manner for the detection of antibodies in a test sample.

- The "reverse" assay comprises the stepwise addition of a solution of detectable antibody to the test sample followed by an incubation period and the addition of antibody bound to a solid phase support after an additional incubation period. The solid  
20 phase support is washed in conventional fashion to remove unbound protein/antibody complexes and unreacted detectable antibody. The determination of detectable antibody associated with the solid phase support is then determined as in the "simultaneous" and "forward" assays. The reverse assay may also be adapted in a similar manner for the detection of antibodies in a test sample.

- 25 The first component of the immunometric assay may be added to nitrocellulose or other solid phase support which is capable of immobilizing proteins. The first component for determining the presence of CDX1 in a test sample is an anti-CDX1 antibody. By "solid phase support" or "support" is intended any material capable of binding proteins. Well-known solid phase supports include glass, polystyrene,  
30 polypropylene, polyethylene, dextran, nylon, amylases, natural and modified celluloses,

polyacrylamides, agaroses, and magnetite. The nature of the support can be either soluble to some extent or insoluble for the purposes of the present invention. The support configuration may be spherical, as in a bead, or cylindrical, as in the inside surface of a test tube or the external surface of a rod. Alternatively, the surface may be flat such as a sheet, 5 test strip, etc. Those skilled in the art will know many other suitable "solid phase supports" for binding proteins or will be able to ascertain the same by use of routine experimentation. A preferred solid phase support is a 96-well microtiter plate.

To detect the presence of CDX1, detectable anti-CDX1 antibodies are used. Several methods are well known for the detection of antibodies.

- 10 One method in which the antibodies can be detectably labeled is by linking the antibodies to an enzyme and subsequently using the antibodies in an enzyme immunoassay (EIA) or enzyme-linked immunosorbent assay (ELISA), such as a capture ELISA. The enzyme, when subsequently exposed to its substrate, reacts with the substrate and generates a chemical moiety which can be detected, for example, by
- 15 spectrophotometric, fluorometric or visual means. Enzymes which can be used to detectably label antibodies include, but are not limited to malate dehydrogenase, staphylococcal nuclease, delta-5-steroid isomerase, yeast alcohol dehydrogenase, alpha-glycerophosphate dehydrogenase, triose phosphate isomerase, horseradish peroxidase, alkaline phosphatase, asparaginase, glucose oxidase, beta-galactosidase, ribonuclease,
- 20 urease, catalase, glucose-6-phosphate dehydrogenase, glucoamylase and acetylcholinesterase. One skilled in the art would readily recognize other enzymes which may also be used.

- Another method in which antibodies can be detectably labeled is through radioactive isotopes and subsequent use in a radioimmunoassay (RIA) (see, for example,
- 25 Work, T.S. *et al.*, *Laboratory Techniques and Biochemistry in Molecular Biology*, North Holland Publishing Company, N.Y., 1978, which is incorporated herein by reference). The radioactive isotope can be detected by such means as the use of a gamma counter or a scintillation counter or by autoradiography. Isotopes which are particularly useful for the purpose of the present invention are  $^3\text{H}$ ,  $^{125}\text{I}$ ,  $^{131}\text{I}$ ,  $^{35}\text{S}$ , and  $^{14}\text{C}$ . Preferably  $^{125}\text{I}$  is the isotope.
- 30 One skilled in the art would readily recognize other radioisotopes which may also be used.

It is also possible to label the antibody with a fluorescent compound. When the fluorescent-labeled antibody is exposed to light of the proper wave length, its presence can be detected due to its fluorescence. Among the most commonly used fluorescent labeling compounds are fluorescein isothiocyanate, rhodamine, phycoerythrin,

- 5    phycocyanin, allophycocyanin, o-phthaldehyde and fluorescamine. One skilled in the art would readily recognize other fluorescent compounds which may also be used.

Antibodies can also be detectably labeled using fluorescence-emitting metals such as  $^{152}\text{Eu}$ , or others of the lanthanide series. These metals can be attached to the protein-specific antibody using such metal chelating groups as

- 10    diethylenetriaminepentaacetic acid (DTPA) or ethylenediamine-tetraacetic acid (EDTA). One skilled in the art would readily recognize other fluorescence-emitting metals as well as other metal chelating groups which may also be used.

Antibody can also be detectably labeled by coupling to a chemiluminescent compound. The presence of the chemiluminescent-labeled antibody is determined by  
15    detecting the presence of luminescence that arises during the course of a chemical reaction. Examples of particularly useful chemoluminescent labeling compounds are luminol, isoluminol, therrromatic acridinium ester, imidazole, acridinium salt and oxalate ester. One skilled in the art would readily recognize other chemiluminescent compounds which may also be used.

- 20        Likewise, a bioluminescent compound may be used to label antibodies. Bioluminescence is a type of chemiluminescence found in biological systems in which a catalytic protein increases the efficiency of the chemiluminescent reaction. The presence of a bioluminescent protein is determined by detecting the presence of luminescence. Important bioluminescent compounds for purposes of labeling are luciferin, luciferase and  
25    aequorin. One skilled in the art would readily recognize other bioluminescent compounds which may also be used.

- Detection of the protein-specific antibody, fragment or derivative may be accomplished by a scintillation counter if, for example, the detectable label is a radioactive gamma emitter. Alternatively, detection may be accomplished by a fluorometer if, for  
30    example, the label is a fluorescent material. In the case of an enzyme label, the detection

can be accomplished by colorimetric methods which employ a substrate for the enzyme. Detection may also be accomplished by visual comparison of the extent of enzymatic reaction of a substrate in comparison with similarly prepared standards. One skilled in the art would readily recognize other appropriate methods of detection which may also be  
5 used.

The binding activity of a given lot of antibodies may be determined according to well known methods. Those skilled in the art will be able to determine operative and optimal assay conditions for each determination by employing routine experimentation.

10 Positive and negative controls may be performed in which known amounts of CDX1 proteins and no CDX1 protein, respectively, are added to assays being performed in parallel with the test assay. One skilled in the art would have the necessary knowledge to perform the appropriate controls. In addition, the kit may comprise instructions for performing the assay. Additionally the kit may optionally comprise depictions or  
15 photographs that represent the appearance of positive and negative results.

CDX1 may be produced as a reagent for positive controls routinely. One skilled in the art would appreciate the different manners in which the CDX1 protein may be produced and isolated.

Antibody composition refers to the antibody or antibodies required for the  
20 detection of the protein. For example, the antibody composition used for the detection of a CDX1 in a test sample comprises a first antibody that binds to the CDX1 as well as a second or third detectable antibody that binds the first or second antibody, respectively.

To examine a test sample for the presence of a CDX1, a standard immunometric assay such as the one described below may be performed. A first anti-  
25 CDX1 antibody, which recognizes a specific portion of CDX1, is added to a 96-well microtiter plate in a volume of buffer. The plate is incubated for a period of time sufficient for binding to occur and subsequently washed with PBS to remove unbound antibody. The plate is then blocked with a PBS/BSA solution to prevent sample proteins from non-specifically binding the microtiter plate. Test sample are subsequently added to the wells  
30 and the plate is incubated for a period of time sufficient for binding to occur. The wells are

washed with PBS to remove unbound protein. Labeled anti-CDX1 antibodies, which recognize portions of CDX1 not recognized by the first antibody, are added to the wells. The plate is incubated for a period of time sufficient for binding to occur and subsequently washed with PBS to remove unbound, labeled anti-CDX1 antibody. The amount of

5 labeled and bound anti-CDX1 antibody is subsequently determined by standard techniques.

Kits which are useful for the detection of CDX1 in a test sample comprise a container comprising anti-CDX1 antibodies and a container or containers comprising controls. Controls include one control sample which does not contain CDX1 and/or another control sample which contained the CDX1. The anti-CDX1 antibodies used in the

10 kit are detectable such as being detectably labeled. If the detectable anti-CDX1 antibody is not labeled, it may be detected by second antibodies or protein A for example which may also be provided in some kits in separate containers. Additional components in some kits include solid support, buffer, and instructions for carrying out the assay. Additionally the kit may optionally comprise depictions or photographs that represent the appearance of

15 positive and negative results.

The immunoassay is useful for detecting CDX1 in homogenized tissue samples and body fluid samples including the plasma portion or cells in the fluid sample.

Western Blots may be useful in assisting the diagnosis of individuals suffering from stomach or esophageal cancer by detecting presence of CDX1 of non-

20 colorectal tissue or body fluid. Western blots may also be used to detect presence of CDX1 in sample of tumor from an individual suffering from cancer. Western blots use detectable anti-CDX1 - antibodies to bind to any CDX1 present in a sample and thus indicate the presence of the receptor in the sample.

Western blot techniques, which are described in Sambrook, J. *et al.*, (1989)

25 *Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, which is incorporated herein by reference, are similar to immunoassays with the essential difference being that prior to exposing the sample to the antibodies, the proteins in the samples are separated by gel electrophoresis and the separated proteins are then probed with antibodies. In some preferred embodiments, the

30 matrix is an SDS-PAGE gel matrix and the separated proteins in the matrix are transferred

to a carrier such as filter paper prior to probing with antibodies. Anti-CDX1 antibodies described above are useful in Western blot methods.

Generally, samples are homogenized and cells are lysed using detergent such as Triton-X. The material is then separated by the standard techniques in Sambrook, J. *et al.*, (1989) *Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY.

Kits which are useful for the detection of CDX1 in a test sample by Western Blot comprise a container comprising anti-CDX1 antibodies and a container or containers comprising controls. Controls include one control sample which does not contain CDX1 and/or another control sample which contains CDX1. The anti-CDX1 antibodies used in the kit are detectable such as being detectably labeled. If the detectable anti-CDX1 antibody is not labeled, it may be detected by second antibodies or protein A for example which may also be provided in some kits in separate containers. Additional components in some kits include instructions for carrying out the assay. Additionally the kit may optionally comprise depictions or photographs that represent the appearance of positive and negative results.

Western blots are useful for detecting CDX1 in homogenized tissue samples and body fluid samples including the plasma portion or cells in the fluid sample.

### **Therapeutic and Prophylactic Vaccines**

The invention relates to prophylactic and therapeutic vaccines for protecting individuals against metastasized colorectal cancer cells and primary and/or metastatic stomach or esophageal cancer cells and for treating individuals who are suffering from metastasized colorectal cancer cells and primary and/or metastatic stomach or esophageal cancer cells.

According to the present invention, CDX1 serves as targets against which a protective and therapeutic immune response can be induced. Specifically, vaccines are provided which induce an immune response against CDX1. The vaccines of the invention include, but are not limited to, the following vaccine technologies:

- 1) DNA vaccines, i.e. vaccines in which DNA that encodes at least an epitope from an CDX1 is administered to an individual's cells where the epitope is expressed and serves as a target for an immune response;
- 2) infectious vector mediated vaccines such as recombinant adenovirus, vaccinia, *Salmonella*, and BCG wherein the vector carries genetic information that encodes at least an epitope from an CDX1 protein such that when the infectious vector is administered to an individual, the epitope is expressed and serves as a target for an immune response;
- 3) killed or inactivated vaccines which a) comprise either killed cells or inactivated viral particles that display at least an epitope from an CDX1 protein and b) when administered to an individual serves as a target for an immune response;
- 4) haptenized killed or inactivated vaccines which a) comprise either killed cells or inactivated viral particles that display at least an epitope from an CDX1 protein, b) are haptenized to be more immunogenic and c) when administered to an individual serves as a target for an immune response;
- 5) subunit vaccines which are vaccines that include protein molecules that include at least an epitope from an CDX1 protein; and
- 6) haptenized subunit vaccines which are vaccines that a) include protein molecules that include at least an epitope from an CDX1 protein and b) are haptenized to be more immunogenic.

The present invention relates to administering to an individual a protein or nucleic acid molecule that comprises or encodes, respectively, an immunogenic epitope against which a therapeutic and prophylactic immune response can be induced. Such epitopes are generally at least 6-8 amino acids in length. The vaccines of the invention therefore comprise proteins which are at least, or nucleic acids which encode at least, 6-8 amino acids in length from CDX1 protein. The vaccines of the invention may comprise proteins which are at least, or nucleic acids which encode at least 10 to about 1000 amino acids in length. The vaccines of the invention may comprise proteins which are at least, or nucleic acids which encode at least, about 25 to about 500 amino acids in length. The vaccines of the invention may comprise proteins which are at least, or nucleic acids which

encode at least, about 50 to about 400 amino acids in length. The vaccines of the invention may comprise proteins which are at least, or nucleic acids which encode at least, about 100 to about 300 amino acids in length.

- The present invention relates to compositions for and methods of treating
- 5 individuals who are known to have metastasized colorectal cancer cells and primary and/or metastatic stomach or esophageal cancer cells. Metastasized colorectal cancer and primary and/or metastatic stomach or esophageal cancer may be diagnosed by those having ordinary skill in the art using the methods described herein or art accepted clinical and laboratory pathology protocols. The present invention provides an immunotherapeutic
- 10 vaccine useful to treat individuals who have been diagnosed as suffering from metastatic colorectal cancer and primary and/or metastatic stomach or esophageal cancer. The immunotherapeutic vaccines of the present invention may be administered in combination with other therapies.

- The present invention relates to compositions for and methods of preventing
- 15 metastatic colorectal cancer and primary and/or metastatic stomach or esophageal cancer in individual is suspected of being susceptible to colorectal, stomach or esophageal cancer. Such individuals include those whose family medical history indicates above average incidence of colorectal, stomach or esophageal cancer among family members and/or those who have already developed colorectal, stomach or esophageal cancer and have been
- 20 effectively treated who therefore face a risk of relapse and recurrence. Such individuals include those which have been diagnosed as having colorectal, stomach or esophageal cancer including localized only or localized and metastasized colorectal, stomach or esophageal cancer which has been resected or otherwise treated. The vaccines of the present invention may be to susceptible individuals prophylactically to prevent and combat
- 25 metastatic colorectal cancer and primary and metastatic stomach or esophageal cancer.

The invention relates to compositions which are the active components of such vaccines or required to make the active components, to methods of making such compositions including the active components, and to methods of making and using vaccines.

The amino acid and nucleotide sequences of the CDX1 is set forth as SEQ ID NO:1.

The present invention relates to recombinant vectors, including expression vectors, that comprise the CDX1 gene transcript or a fragment thereof. The present  
5 invention relates to recombinant vectors, including expression vectors that comprise nucleotide sequences that encode a CDX1 protein or a functional fragment thereof.

The present invention relates to host cells which comprise such vectors and to methods of making CDX1 protein using such recombinant cells.

The present invention relates to the isolated CDX1 gene transcript and to the  
10 isolated CDX1 proteins and to isolated antibodies specific for such protein and to hybridomas which produce such antibodies.

The present invention relates to the isolated CDX1 and functional fragments thereof. Accordingly, some aspects of the invention relate to isolated proteins that  
comprise at least one epitope of an CDX1.

15 Some aspects of the invention relate to the above described isolated proteins which are haptenized to render them more immunogenic. That is, some aspects of the invention relate to haptenized proteins that comprise at least one CDX1 epitope.

Accordingly, some aspects of the invention relate to isolated nucleic acid molecules that encode proteins that comprise at least one CDX1 epitope.

20 Naked DNA vaccines are described in PCT/US90/01515, which is incorporated herein by reference. Others teach the use of liposome mediated DNA transfer, DNA delivery using microprojectiles (U.S. Patent No. 4,945,050 issued July 31, 1990 to Sanford et al., which is incorporated herein by reference), and DNA delivery using electroporation. In each case, the DNA may be plasmid DNA that is produced in bacteria,  
25 isolated and administered to the animal to be treated. The plasmid DNA molecules are taken up by the cells of the animal where the sequences that encode the protein of interest are expressed. The protein thus produced provides a therapeutic or prophylactic effect on the animal.

The use of vectors including viral vectors and other means of delivering  
30 nucleic acid molecules to cells of an individual in order to produce a therapeutic and/or

prophylactic immunological effect on the individual are similarly well known.

Recombinant vaccines that employ vaccinia vectors are, for example, disclosed in U.S.

Patent Number 5,017,487 issued May 21, 1991 to Stunnenberg *et al.* which is incorporated herein by reference.

- 5 In some cases, tumor cells from the patient are killed or inactivated and administered as a vaccine product. Berd *et al.* May 1986 *Cancer Research* 46:2572-2577 and Berd *et al.* May 1991 *Cancer Research* 51:2731-2734, which are incorporated herein by reference, describes the preparation and use of tumor cell based vaccine products. According to some aspects of the present invention, the methods and techniques described
- 10 in Berd *et al.* are adapted by using colorectal, stomach or esophageal cancer cells instead of melanoma cells.

- The manufacture and use of isolated translation products and fragments thereof useful for example as laboratory reagents or components of subunit vaccines are well known. One having ordinary skill in the art can isolate the CDX1 gene transcript or
- 15 the specific portion thereof that encodes CDX1 or a fragment thereof. Once isolated, the nucleic acid molecule can be inserted it into an expression vector using standard techniques and readily available starting materials.

- The recombinant expression vector that comprises a nucleotide sequence that encodes the nucleic acid molecule that encodes CDX1 or a fragment thereof or a protein
- 20 that comprises the CDX1 or a fragment thereof. The recombinant expression vectors of the invention are useful for transforming hosts to prepare recombinant expression systems for preparing the isolated proteins of the invention.

- The present invention relates to a host cell that comprises the recombinant expression vector that includes a nucleotide sequence that encodes CDX1 protein or a
- 25 fragment thereof or an CDX1 or a fragment thereof. Host cells for use in well known recombinant expression systems for production of proteins are well known and readily available. Examples of host cells include bacteria cells such as *E. coli*, yeast cells such as *S. cerevisiae*, insect cells such as *S. frugiperda*, non-human mammalian tissue culture cells chinese hamster ovary (CHO) cells and human tissue culture cells such as HeLa cells.

The present invention relates to a transgenic non-human mammal that comprises the recombinant expression vector that comprises a nucleic acid sequence that encodes the proteins of the invention. Transgenic non-human mammals useful to produce recombinant proteins are well known as are the expression vectors necessary and the techniques for generating transgenic animals. Generally, the transgenic animal comprises a recombinant expression vector in which the nucleotide sequence that encodes CDX1 or a fragment thereof or a protein that comprises CDX1 or a fragment thereof operably linked to a mammary cell specific promoter whereby the coding sequence is only expressed in mammary cells and the recombinant protein so expressed is recovered from the animal's milk.

In some embodiments, for example, one having ordinary skill in the art can, using well known techniques, insert such DNA molecules into a commercially available expression vector for use in well known expression systems such as those described herein.

The expression vector including the DNA that encodes a CDX1 or a functional fragment thereof or a protein that comprises a CDX1 or a functional fragment thereof is used to transform the compatible host which is then cultured and maintained under conditions wherein expression of the foreign DNA takes place. The protein of the present invention thus produced is recovered from the culture, either by lysing the cells or from the culture medium as appropriate and known to those in the art. The methods of purifying the CDX1 or a fragment thereof or a protein that comprises the same using antibodies which specifically bind to the protein are well known. Antibodies which specifically bind to a particular protein may be used to purify the protein from natural sources using well known techniques and readily available starting materials. Such antibodies may also be used to purify the protein from material present when producing the protein by recombinant DNA methodology. The present invention relates to antibodies that bind to an epitope which is present on one or more CDX1-1 translation products or a fragment thereof or a protein that comprises the same. Antibodies that bind to an epitope which is present on the CDX1 are useful to isolate and purify the protein from both natural sources or recombinant expression systems using well known techniques such as affinity chromatography. Immunoaffinity techniques generally are described in Waldman *et al.*

1991 *Methods of Enzymol.* **195**:391-396, which is incorporated herein by reference.

Antibodies are useful to detect the presence of such protein in a sample and to determine if cells are expressing the protein. The production of antibodies and the protein structures of complete, intact antibodies, Fab fragments and F(ab)<sub>2</sub> fragments and the organization of the

- 5 genetic sequences that encode such molecules are well known and are described, for example, in Harlow, E. and D. Lane (1988) *ANTIBODIES: A Laboratory Manual*, Cold Spring Harbor Laboratory, Cold Spring Harbor, NY. which is incorporated herein by reference.

- In some embodiments of the invention, transgenic non-human animals are
- 10 generated. The transgenic animals according to the invention contain nucleotides that encode CDX1 or a fragment thereof or a protein that comprises the same under the regulatory control of a mammary specific promoter. One having ordinary skill in the art using standard techniques, such as those taught in U.S. Patent No. 4,873,191 issued October 10, 1989 to Wagner and U.S. Patent No. 4,736,866 issued April 12, 1988 to Leder,
- 15 both of which are incorporated herein by reference, can produce transgenic animals which produce CDX1 or a fragment thereof or a protein that comprises the same. Preferred animals are goats and rodents, particularly rats and mice.

- In addition to producing these proteins by recombinant techniques, automated peptide synthesizers may also be employed to produce CDX1 or a fragment
- 20 thereof or a fragment thereof or a protein that comprises the same. Such techniques are well known to those having ordinary skill in the art and are useful if derivatives which have substitutions not provided for in DNA-encoded protein production.

- In some embodiments, the protein that makes up a subunit vaccine or the cells or particles of a killed or inactivated vaccine may be haptenized to increase
- 25 immunogenicity. In some cases, the haptenization is the conjugation of a larger molecular structure to CDX1 or a fragment thereof or a protein that comprises the same. In some cases, tumor cells from the patient are killed and haptenized as a means to make an effective vaccine product. In cases in which other cells, such as bacteria or eukaryotic cells which are provided with the genetic information to make and display a CDX1 or a
- 30 fragment thereof or a protein that comprises the same, are killed and used as the active

vaccine component, such cells are haptenized to increase immunogenicity. Haptenization is well known and can be readily performed.

Methods of haptenizing cells generally and tumor cells in particular are described in Berd *et al.* May 1986 *Cancer Research* **46**:2572-2577 and Berd *et al.* May 5 1991 *Cancer Research* **51**:2731-2734, which are incorporated herein by reference. Additional haptenization protocols are disclosed in Miller *et al.* 1976 *J. Immunol.* **117**(5:1):1591-1526.

Haptenization compositions and methods which may be adapted to be used to prepare haptenized CDX1 immunogens according to the present invention include those described in the following U.S. Patents which are each incorporated herein by reference: 10 U.S. Patent Number 5,037,645 issued August 6, 1991 to Strahilevitz; U.S. Patent Number 5,112,606 issued May 12, 1992 to Shiosaka *et al.*; U.S. Patent Number 4,526,716 issued July 2, 1985 to Stevens; U.S. Patent Number 4,329,281 issued May 11, 1982 to Christenson *et al.*; and U.S. Patent Number 4,022,878 issued May 10, 1977 to Gross. 15 Peptide vaccines and methods of enhancing immunogenicity of peptides which may be adapted to modify CDX1 immunogens of the invention are also described in Francis *et al.* 1989 *Methods of Enzymol.* **178**:659-676, which is incorporated herein by reference. Sad *et al.* 1992 *Immunology* **76**:599-603, which is incorporated herein by reference, teaches methods of making immunotherapeutic vaccines by conjugating gonadotropin releasing 20 hormone to diphtheria toxoid. CDX1 immunogens may be similarly conjugated to produce an immunotherapeutic vaccine of the present invention. MacLean *et al.* 1993 *Cancer Immunol. Immunother.* **36**:215-222, which is incorporated herein by reference, describes conjugation methodologies for producing immunotherapeutic vaccines which may be adaptable to produce an immunotherapeutic vaccine of the present invention. The hapten 25 is keyhole limpet hemocyanin which may be conjugated to a CDX1 immunogen.

Vaccines according to some aspects of the invention comprise a pharmaceutically acceptable carrier in combination with a CDX1 immunogen. Pharmaceutical formulations are well known and pharmaceutical compositions comprising such proteins may be routinely formulated by one having ordinary skill in the art. Suitable 30 pharmaceutical carriers are described in *Remington's Pharmaceutical Sciences*, A. Osol, a

standard reference text in this field, which is incorporated herein by reference. The present invention relates to an injectable pharmaceutical composition that comprises a pharmaceutically acceptable carrier and a CDX1 immunogen. The CDX1 immunogen is preferably sterile and combined with a sterile pharmaceutical carrier.

- 5 In some embodiments, for example, CDX1 or a fragment thereof or a fragment thereof or a protein that comprises the same can be formulated as a solution, suspension, emulsion or lyophilized powder in association with a pharmaceutically acceptable vehicle. Examples of such vehicles are water, saline, Ringer's solution, dextrose solution, and 5% human serum albumin. Liposomes and nonaqueous vehicles
- 10 such as fixed oils may also be used. The vehicle or lyophilized powder may contain additives that maintain isotonicity (e.g., sodium chloride, mannitol) and chemical stability (e.g., buffers and preservatives). The formulation is sterilized by commonly used techniques.

- An injectable composition may comprise the CDX1 immunogen in a diluting
- 15 agent such as, for example, sterile water, electrolytes/dextrose, fatty oils of vegetable origin, fatty esters, or polyols, such as propylene glycol and polyethylene glycol. The injectable must be sterile and free of pyrogens.

- The vaccines of the present invention may be administered by any means that enables the immunogenic agent to be presented to the body's immune system for
- 20 recognition and induction of an immunogenic response. Pharmaceutical compositions may be administered parenterally, i.e., intravenous, subcutaneous, intramuscular.

- Dosage varies depending upon known factors such as the pharmacodynamic characteristics of the particular agent, and its mode and route of administration; age, health, and weight of the recipient; nature and extent of symptoms, kind of concurrent treatment,
- 25 frequency of treatment, and the effect desired. An amount of immunogen is delivered to induce a protective or therapeutically effective immune response. Those having ordinary skill in the art can readily determine the range and optimal dosage by routine methods.
